For: **A METHOD AND APPARATUS FOR ASSISTING LEFT-HANDED MANIPULATION
OF A VEHICLE IGNITION SWITCH**

PATENT APPLICATION AND
CERTIFICATE OF MAILING

Honorable Commissioner
U.S. Patent and Trademark Office
Washington, D.C. 20231

Sir:

Pursuant to the provisions of 35 U.S.C. 21(a) as amended by Public Law 97-247 and 37 C.F.R. 1.10, the above-identified Applicant encloses for filing the attached Patent Application entitled **A METHOD AND APPARATUS FOR ASSISTING LEFT-HANDED MANIPULATION OF A VEHICLE IGNITION SWITCH**. This application includes 10 sheets of specification, 5 sheets of formal drawings and a check in the amount of \$370.00 to cover the Basic Filing Fee. This Application is being filed on March 4, 2002 by mailing an application to Commissioner of Patents and Trademarks, Box New Applications, Washington D.C. 20231, via the United States Postal Service under 37 C.F.R. 1.10. The Express Mail Label number appears in the heading of this paper which is attached to the Application papers pursuant to 37 C.F.R. 1.10(b).

CERTIFICATE OF MAILING

"Express Mail" Mailing Label No: EL797751596US

Date of Deposit: March 4, 2002

I hereby certify that this paper, fee and attachments are being deposited with the United States Postal Service "Express Mail Post Office to Addressee" service under 37 C.F.R. 1.10 on the date indicated above and is addressed to the Commissioner of Patents and Trademarks, Box New Applications, Washington D.C. 20231.

Dated: March 4, 2002

Robert K. Tendler

APPLICATION FOR LETTERS PATENT

TO ALL WHOM IT MAY CONCERN:

BE IT KNOWN THAT Marybeth Enright, a citizen of the United States of America, having a residence at 295 Corey Street, West Roxbury, MA has invented a certain new and useful method and apparatus, a METHOD AND APPARATUS FOR ASSISTING LEFT-HANDED MANIPULATION OF A VEHICLE IGNITION SWITCH.

204060" ET 215001

FIELD OF INVENTION

This invention relates to systems for assisting left-handed individuals and more particularly, to assist them for permitting for an individual who has little or no use of his right hand to be able to start a vehicle.

BACKGROUND OF THE INVENTION

As will be appreciated, vehicles are provided with an ignition system including an ignition key which is inserted into an ignition switch slot in order to turn on the vehicle and to permit the driving thereof.

Invariably, all of the ignition key slots are located to the right-hand side of the steering wheel, with the key being inserted into the ignition switch slot which is either on the dash to the right of the wheel or on the steering column to the right of the wheel.

While these systems work adequately for right-handed individuals, for left-handed individuals, either the individual has to utilize his right hand, not his dominant hand, in order to start the vehicle; or, in the case of disabled individuals, the left-handed individual must reach around or under the steering wheel and position his or her hand in a backwards position in order to be able to insert the key into the key slot which lies to the right-hand side of the wheel.

For those who have right hand impairments, it is only with difficulty that the vehicle can be started. Not only is this because of the difficulty in reaching around with one's left hand to a position to the right of the wheel, often times the ignition system includes mechanical unlocking of the steering column, which requires significant pressure on the key to be able to both initiate the ignition and unlock the steering column.

For those who are not able to use their right hands, the keys will sometimes snap off in the key slot due to the awkward angle at which the individual must turn the key. Thus, not only is it

inconvenient for these people to have the key slot to the right of the wheel, it also can result in the total inability of the individual to turn on the vehicle if the key snaps off in the key slot due to the awkward angle at which the individual is trying to turn on the vehicle.

Thus, it is important for left-handed individuals or those having an impaired right hand to have some way of starting the vehicle without undue or unnecessary contortions.

SUMMARY OF THE INVENTION

In order to accommodate left-handed individuals or those having an impaired right hand, in the subject invention, a key slot for the ignition key is provided to the left of the wheel of the vehicle to permit easy access with the left hand, thus to eliminate the problems of having to reach around the wheel and insert the key with one's left hand into a right-sided key slot.

For ignition switches that are mounted to the dash of the vehicle, then in one embodiment an ignition switch which duplicates the action of the ignition switch to the right-hand side of the vehicle is provided on the dash at the left-hand side of the steering wheel. Its function is identical to that of the ignition switch to the right-hand side and thereby permits a left-handed individual or one having an impaired right hand to be able to start the vehicle with ease.

In a second embodiment, a pair of key slots is provided in diametrically opposed positions on the steering column such that a key can be inserted either in the right-hand slot or the left-hand slot in order to start the vehicle and unlock the steering wheel such as desired.

Alternatively, and in a second embodiment, a rotatable collar is positioned on the steering column with the collar having an ignition switch which receives an ignition key in order to turn on the vehicle. This collar is rotatable 180 degrees about the steering column, such that for left-handed individuals or those having impaired right hands the ignition key can be inserted from the left by the left hand.

In all of the above embodiments, it is clear that with vehicles supplied with left-hand key slots for ignition keys, the vehicle can be turned on and the driver accommodated, thus to alleviate the awkwardness and clumsiness associated with prior right-hand key ignition switches.

In summary, a system is provided for aiding left-handed individuals or individuals whose right hands are immobilized to be able to start a vehicle by turning an ignition key in which the key slot is movable or placeable to the left of the steering wheel at the driver's option to permit starting of the vehicle utilizing an individual's left hand only. In one embodiment a duplicate key slot is positioned to the left of the steering wheel on the dash of the car or, in a further embodiment, for key slots mounted to the steering column, the column is provided with a duplicate key slot to the left-hand side of the column. In another embodiment, a rotatable sleeve or collar is made part of the steering column, which when rotated rotates the key slot from an initial right-hand position to a left-hand position, thus to enable the starting of the vehicle only utilizing one's left hand.

BRIEF DESCRIPTION OF THE DRAWINGS

These and other features of the subject invention will be better understood in connection with the Detailed Description in conjunction with the Drawings, of which:

Figure 1A is a diagrammatic illustration of the contortions necessary for a left-handed individual to be able to insert a key into a right-handed key slot;

Figure 1B is a diagrammatic illustration of the situation depicted in Figure 1A, in which the motion of the left-hand to address a right-handed key slot for right-handed entry of the key is depicted;

Figure 2 is a diagrammatic illustration of the subject invention in which an ignition switch having a key slot is positioned to the left-hand side of the steering wheel of the vehicle and is

connected in parallel with the key ignition switch located on the right-hand side of the wheel on the dashboard of the vehicle;

Figure 3 is a diagrammatic and top illustration of the utilization of two key slots, one extending to the right of the wheel of the vehicle and the other to the left, indicating a duplicate key slot on the steering column for use by a left-handed or right-hand impaired individual;

Figure 4A is a diagrammatic illustration of the utilization of an ignition switch having a key slot which is mounted on a collar on the steering column which can be rotated from a right-hand position to a left-hand position; and,

Figure 4B is a diagrammatic illustration of the ignition switch and key slot of Figure 4A indicating its movement 180 degrees so as to provide left-handed slot entry for the ignition key.

DETAILED DESCRIPTION:

Referring now to Figure 1, an individual 10 is shown having an arm 12 which is reaching under a steering wheel 14 of a vehicle 16 in which the wrist 18 of individual 10 is bent in an awkward position so as to be able to insert key 20 into a right-handed ignition switch at the column of wheel 14.

It will be appreciated, referring to Figure 1B, that in one embodiment, the path that arm 12 and wrist 18 must follow is along dotted path 22 such that key 20 can be appropriately inserted into slot 24 of ignition switch 26 so that the vehicle can be turned on.

Whether the individual reaches under wheel 14 or over it, the amount of side pressure necessary to turn key 20 is relatively high to both turn the ignition switch and unlock the steering column for those vehicles that have a steering column lock which is unlocked through turning the ignition key.

So awkward and difficult is the turning on of such a vehicle for a left-handed person or one having a right hand that is disabled that the key often times cannot be inserted properly or if inserted is sometimes broken off due to the awkward angle which key 20 is grasped by the left hand.

Referring now to Figure 2, in one embodiment of the subject invention, an ignition switch 30 is positioned to the left-hand side of wheel 14 on dash 32 of vehicle 16, with the vehicle being provided as is common with a right-hand ignition switch 30'.

As will be seen electrically and mechanically, these switches are connected and parallel such that in one embodiment, not only is the closure of a key switch communicated over lines 34 to the vehicle's ignition system, the same switch closures communicated to an actuator 36 in turn coupled to an electromechanical steering wheel unlocking system 38 such that the vehicle can be started from either the left-hand or right-hand position with either of the person's left hand or right hand while at the same time also unlocking the steering wheel by virtue of turning the key in the switch slot of the corresponding ignition switch.

Referring to Figure 3, in another embodiment, ignition switch key slots 40 and 42 are provided on diametrically opposite sides of steering column 44 such that a key 46 can be inserted from the right or from the left, as illustrated. This means that for left-handed people or those having impaired right hands the person uses his or her left hand to insert the key into key slot 42 as opposed to key slot 40, thus enabling the individual to conveniently turn on and operate the vehicle.

Referring to Figure 4A, in a still further embodiment, an ignition switch 50 may be housed in a rotatable collar 52 which is assembled on the steering column, with ignition switch 50 having a key slot 54 which in Figure 4A extends to the right to permit a key 56 to enter from the right and to turn the ignition switch.

For left-handed individuals or those having right-hand infirmities, the collar in Figure 4A can be rotated as illustrated at arrow 58 such that it arrives in the position shown in Figure 4B illustrated by 50'. Key 56' is thereby permitted to activate the car or the vehicle by insertion from the left, with the rotation of the collar permitting positioning of the original right-hand entry key slot so that it is accessible from the left and therefore by a person who is left-handed or using one's left hand.

In summary, it will be seen that what is provided is a system for permitting left-handed people or those having right-hand impairments to easily turn on a vehicle through the utilization of a vehicle ignition switch without having to resort to contortions or movements which can sometimes cause the breaking of the key within the key slot.

Vehicles can thus be manufactured with either ignition switches to the left-hand side of the wheel on the dash, or with key slot access to the left of the steering column, thus to provide handicapped access to the vehicles while at the same time accommodating those individuals who are naturally left-handed.

Having now described a few embodiments of the invention, and some modifications and variations thereto, it should be apparent to those skilled in the art that the foregoing is merely illustrative and not limiting, having been presented by the way of example only. Numerous modifications and other embodiments are within the scope of one of ordinary skill in the art and are contemplated as falling within the scope of the invention as limited only by the appended claims and equivalents thereto.
